penetration testing   Windows

Networking   OWASP

PERSONAL PROJECT

LOCATION ENABLED MESSENGER

The suggested application uses GPS technology to communicate depending on location. It may be utilized by anyone who is at the same location for the purpose of conversing. They may use this app to send messages to anyone in their immediate vicinity. If the recipient accepts the request, they will be able to communicate afterwards. It can also be done if they desire to meet each other. If users are in a new place, this program allows them to spend time with someone else who is using the same app. Each client establishes a connection to this messaging application, which allows them to create, send, receive, and read messages. The sender, in reality, does not need to know anything about the recipient, and the receiver, in turn, does not need to know anything about the sender.
